MySQL学习笔记(Day044: replication_4-GTID)

```
MySQL学习笔记(Day044: replication_4-GTID)

一. GTID复制出错的处理

1.1. 在从机上插入一条记录(模拟误操作)
1.2. 在主机上插入同样的记录
1.3. 处理复制错误
1.4. 测试复制

二. 多源复制

2.1. 多源复制的介绍
2.2. 多源复制的演示
2.2.1. 准备数据
2.2.2. 还原Slave
2.2.3. change master
2.2.4. 使用场景

三. 其他注意事项
```

一. GTID复制出错的处理

```
注意:按照之前给出的 /etc/my.cnf 的配置,且在Slave上配置 read_only=1;,复制是 不会出错 的。
```

```
这里仅仅演示一下如果人为的在从机上误操作导致的复制失败,如何恢复。
```

1.1. 在从机上插入一条记录(模拟误操作)

现在 <mark>Slave2</mark> 上插入一条记录(*现实中如果配置了r*eadonly*,在*app*中是无法插入的,app不会给*root*权限*)

1.2. 在主机上插入同样的记录

```
-- Master 端
--
mysql> insert into t_a(b) values(10);
Query OK, 1 row affected (0.00 sec)

mysql> commit;
Query OK, 0 rows affected (0.02 sec)
```

查看 Slave2 上的状态

```
-- Slave2 端
mysql> show slave status\G
Slave_IO_State: Waiting for master to send event
                Master_Host: 172.18.14.70
                Master_User: rpl

SQL_Delay: 0

Seconds_Behind_Master: NULL

Master_SSL_Verify_Server_Cert: No

Retrieved_Gtid_Set: c241b625-e932-11e5-bb11-5254f035dabc:11561-11562 Executed_Gtid_Set: 4729a5ec-fcfc-11e5-8c97-5254f0d46611:1-4, c241b625-e932-11e5-bb11-5254f035dabc:1-11561 -- 只执行到了11561; -- 11562这个事物报错了。 Auto_Position: 1 Replicate_Rewrite_DB: Channel_Name: Master_TLS_Version:

其实从数据一致性看,目前主从数据是一致的,只是复制过来的数据在回放时,发现了自己已经有了该部分数据(*Error:1062*),从而引发了复制异常(*SQL回放线程停止*)。 我们只需要告诉MySQL,"跳过"这部分一样的GTID,继续复制,即可。

1.3. 处理复制错误

1 row in set (0.00 sec)

```
这里的 跳过 的方法很巧妙,步骤如下
 1. 将Slave上的 gtid_next 指向 执行失败 的那个 gtid
      。 这里执行失败的 gtid 报错信息中已经给出: 'c241b625-e932-11e5-bb11-5254f035dabc:11562'
      。如果不看报错信息,可以看 Retrieved_Gtid_Set 和 Executed_Gtid_Set 的对比结果
 2. 执行一个空的事物,即 begin;commit;
      。 这样就把 失败的gtid 对应到了一个 空的事物 上,这个步骤即为"跳过"的意思
 3. 将 gtid_next 设置 ( 还原 ) 为 automatic
   -- Slave 2 端
   mysql> select @@gtid_next; -- 当前为默认值, AUTOMATIC
   | @@gtid_next |
  AUTOMATIC
   +----+
  1 row in set (0.00 sec)
  -- -- 步骤1 : 设置 gtid_next 为回放失败的gtid
  mysql> set gtid_next='c241b625-e932-11e5-bb11-5254f035dabc:11562'; -- 设置为之前失败的那个GTID的值
  Query OK, 0 rows affected (0.00 sec)
   -- -- 步骤2: 执行一个空的事物,让回放失败的gtid对应到这个空的事物
   Query OK, 0 rows affected (0.00 sec)
   mysql> commit;
   Query OK, 0 rows affected (0.00 sec)
   -- -- 步骤3 : 还原gtid_next为automatic
   mysql> set gtid_next="automatic";
   Query OK, 0 rows affected (0.00 sec)
```

```
MySQL DBA学习笔记-----美河学习在线 www.eimhe.com 仅学习参考
        -- Slave 2端
        mysql> stop slave;
        Query OK, 0 rows affected (0.01 sec)
        mysql> start slave;
        Query OK, 0 rows affected (0.07 sec)
        mysql> show slave status\G

                  Master_SSL_Crlpath:
                  Retrieved_Gtid_Set: c241b625-e932-11e5-bb11-5254f035dabc:11561-11562
                   Executed_Gtid_Set: 4729a5ec-fcfc-11e5-8c97-5254f0d46611:1-4,
        c241b625-e932-11e5-bb11-5254f035dabc:1-11562 -- 执行到了11562
                      Auto_Position: 1
                Replicate_Rewrite_DB:
                        Channel_Name:
                  Master_TLS_Version:
        1 row in set (0.00 sec)
     1.4. 测试复制
       1. Master端插入一个测试数据
        -- Master 端
        mysql> insert into t_a(b) values(20);
        Query OK, 1 row affected (0.00 sec)
        mysql> commit;
        Query OK, 0 rows affected (0.03 sec)
        2. 查看Slave2上的数据是否同步
        -- Slave 2 端
        mysql> select * from t_a;
         +---+
```

至此,GTID复制出错的处理就完成了。 **注意:这里仅仅是 ^{跳过错误} ,和原来的 sql_slave_skip_counter** (*该功能在GTID 下失效*)功能类似,无法保证主从数据是一致的(*需要人工介入进行确认,比如仅仅主键一样,其他列不一样*)

如果出现了很多的GTID的错误,可能是从机上有大量的操作,建议 重新搭建主从复制 但还是要在源头上避免此类情况的发生,确保在从机上开启 read_only=1 ,并且避免人工的误操作。

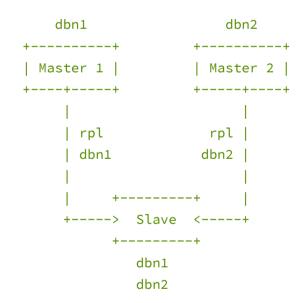

最后强调: GTID 是 基于事物 的复制,一致性要求很高, 强烈建议 在 Slave 上开启 read_only=1

二. 多源复制

2.1. 多源复制的介绍

官方文档 – replication-channels

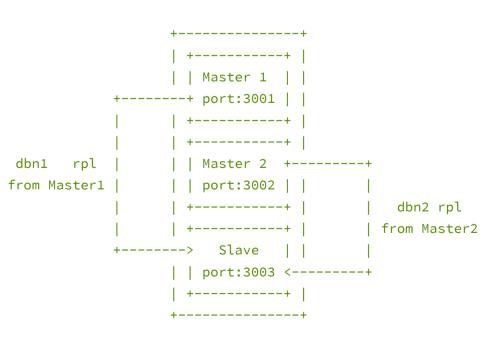

多源复制 是指一个从机,多个主机的复制,从 MySQL5.7.6 才有的功能,如下图所示:

在语法层面上,只是在 原来的change master 的基础上,增加了 for channel 'channel_name'

2.2. 多源复制的演示

这里为了简化拓扑,在一台主机上使用多实例方式来模拟多主机,如下图所示:

2.2.1. 准备数据

```
MySQL DBA学习笔记-----美河学习在线 www.eimhe.com 仅学习参考
        -- Master 1 端
        mysql> select @@port;
        +----+
        | @@port |
        +----+
        | 3001 |
        +----+

    2.2.2. 还原Slave
        ##
        ## Slave 端
        [root@MyServer ~]> mysql -u root -p -S /tmp/mysql.sock_1003 < dbn1.sql</pre>
       Enter password:
       ERROR 1840 (HY000) at line 24: @@GLOBAL.GTID_PURGED can only be set when @@GLOBAL.GTID_EXECUTED is empty.
    还是之前的问题,需要在Slave上,先操作一下 reset master ,以清空 @@GLOBAL.GTID_EXECUTED。
       --
        -- Slave 端
       mysql> reset master;
        Query OK, 0 rows affected (0.07 sec)
        [root@MyServer ~]> mysql -u root -p -S /tmp/mysql.sock_1003 < dbn1.sql</pre>
        Enter password:
        # -- 执行成功
        [root@MyServer ~]> mysql -u root -p -S /tmp/mysql.sock_1003 < dbn2.sql</pre>
       Enter password:
        ERROR 1840 (HY000) at line 24: @@GLOBAL.GTID_PURGED can only be set when @@GLOBAL.GTID_EXECUTED is empty.
        ## -- 再次执行 reset master 后,再恢复dbn2.sql
        [root@MyServer ~]> mysql -u root -p -S /tmp/mysql.sock_1003 < dbn2.sql</pre>
       Enter password:
        # -- 执行成功
        mysql> show databases;
        +----+
        | Database |
        +----+
        | information_schema |
        dbn2
        mysql
       | performance_schema |
       sys
        +----+
       6 rows in set (0.00 sec)
       mysql> select * from dbn1.t_a;
        | a |
        +---+
       | 1 |
        +---+
       1 row in set (0.00 sec)
        mysql> select * from dbn2.b;
       | a |
        +---+
       | 1 |
        +---+
       1 row in set (0.00 sec)
       -- 此时dbn1和dbn2的数据就恢复完成了
```

```

```
MySQL DBA学习笔记------美河学习在线 www.eimhe.com 仅学习参考
       -- Master 1 端
       mysql> insert into t_a values(NULL);
        Query OK, 1 row affected (0.03 sec)
       mysql> commit;
       Query OK, 0 rows affected (0.00 sec)
        -- Master 2 端
       mysql> insert into b values(NULL);
        Query OK, 1 row affected (0.05 sec)
       mysql> commit;
       Query OK, 0 rows affected (0.00 sec)
       -- Slave 端
       mysql> select * from dbn1.t_a;
        +---+
       | a |
        +---+
       | 1 |
       | 2 |
        +---+
       2 rows in set (0.00 sec)
       mysql> select * from dbn2.b;
       | a |
       | 1 |
       | 2 |
        +---+
       2 rows in set (0.00 sec)
     至此,多源复制的主从搭建就完成了。
```

2.2.4. 使用场景

如果 Master2 上也有一个 dbn1 的库,会有问题么?

1. 如果不做额外的配置,是会有错误的;

2. 如果配置了 slave_skip_errors = ddl_exist_errors , 且 没有重复数据 话 , 复制关系还是正常的。

这种操作可以起到 数据聚合 的效果。将分库分表后的数据聚合在一起,以供其他应用进行分析(**前提是数据不能有重复**)。 **但是最合适的场景还是将** 不同的库 **进行复制。**

三. 其他注意事项

1. 中间件的unique key

中间件可以保证分区键是唯一的(比如order_id),但是对于其他唯一索引来说,需要业务层去保证。 2. reset slave all

使用该命令时 不会清空数据 ,仅仅是清空 show slave status\G 里面的信息,所以在使用该命令之前,请 先记录(备份) show slave status\G 的信息。 3. GTID

在开启GTID后,不能在一个事物中使用创建临时表的语句,需要使得 autocommit=1; 才可以。

在开启GTID后,不能使用 create table select ... 的语法来创建表了,因为这其实是多个事物了,GTID没法对应。
